Molecular model for receptor-stimulated calcium spiking

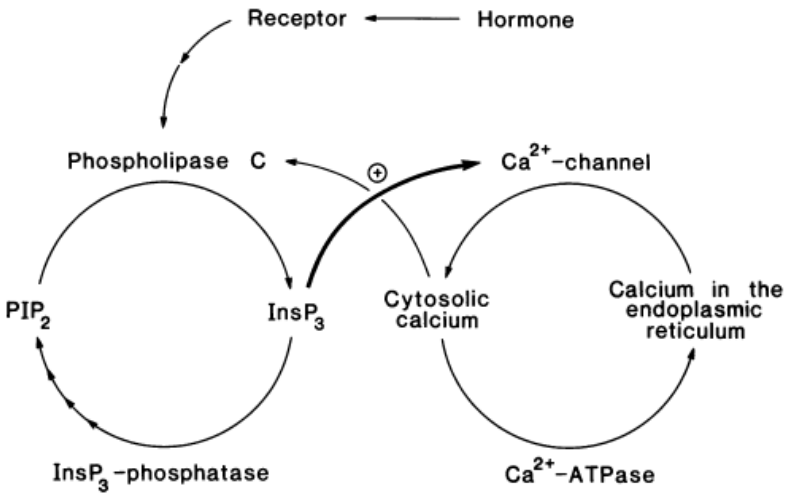
(inositol phospholipid cascade/inositol trisphosphate/calcium channels/oscillations/frequency encoding)

TOBIAS MEYER AND LUBERT STRYER

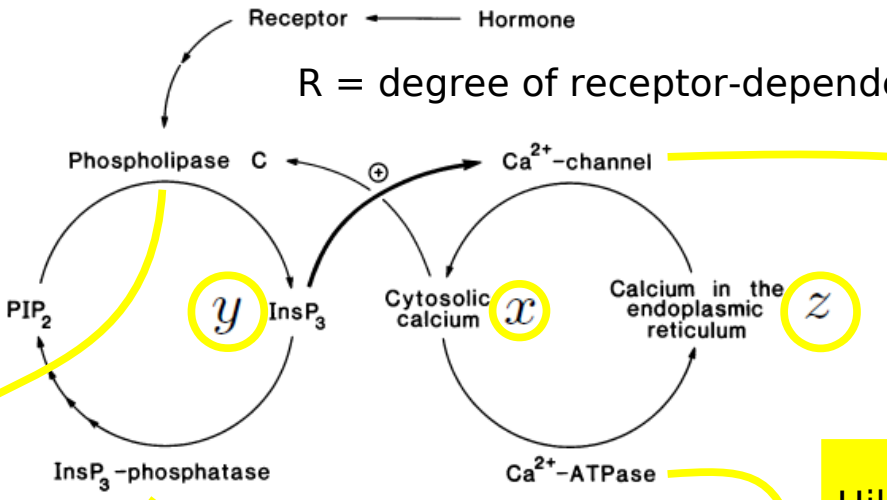
Department of Cell Biology, Sherman Fairchild Center, Stanford University School of Medicine, Stanford, CA 94305

ABSTRACT **Many cells exhibit periodic transient increases in cytosolic calcium levels rather than a sustained rise when stimulated by a hormone or growth factor. We propose here a molecular model that accounts for periodic calcium spiking induced by a constant stimulus. Four elements give rise to repetitive calcium transients: cooperativity and positive feedback between a pair of reciprocally coupled (crosscoupled) messengers, followed by deactivation and then by reactivation. The crosscoupled messengers in our model are inositol 1,4,5-trisphosphate ($InsP_3$) and cytosolic calcium ions. The opening of calcium channels in the endoplasmic reticulum by the binding of multiple molecules of $InsP_3$ provides the required cooperativity. The stimulation of receptor-activated phospholipase C by released calcium ions leads to positive feedback. $InsP_3$ is destroyed by a phosphatase, and calcium ion is pumped back into the endoplasmic reticulum. These processes generate bistability: the cytosolic calcium concentration abruptly increases from a basal level to a stimulated level at a threshold degree of activation of phospholipase C. Spiking further**

receptor controlled, class II



positive feedback



R = degree of receptor-dependent activation

NOT
Hill-like functions!

$$\frac{dy}{dt} = \frac{c_4 R x}{K_3 + x} - c_5 y \qquad \frac{dx}{dt} = -\left(\frac{c_2 x^2}{(K_2 + x)^2} - c_3 z^2\right) + \frac{c_1 y^3 z}{(K_1 + y)^3}$$

"K_1 is the $InsP_3$ concentration at which half the sites are filled" X

$$x + z = \text{constant}$$ conservation law

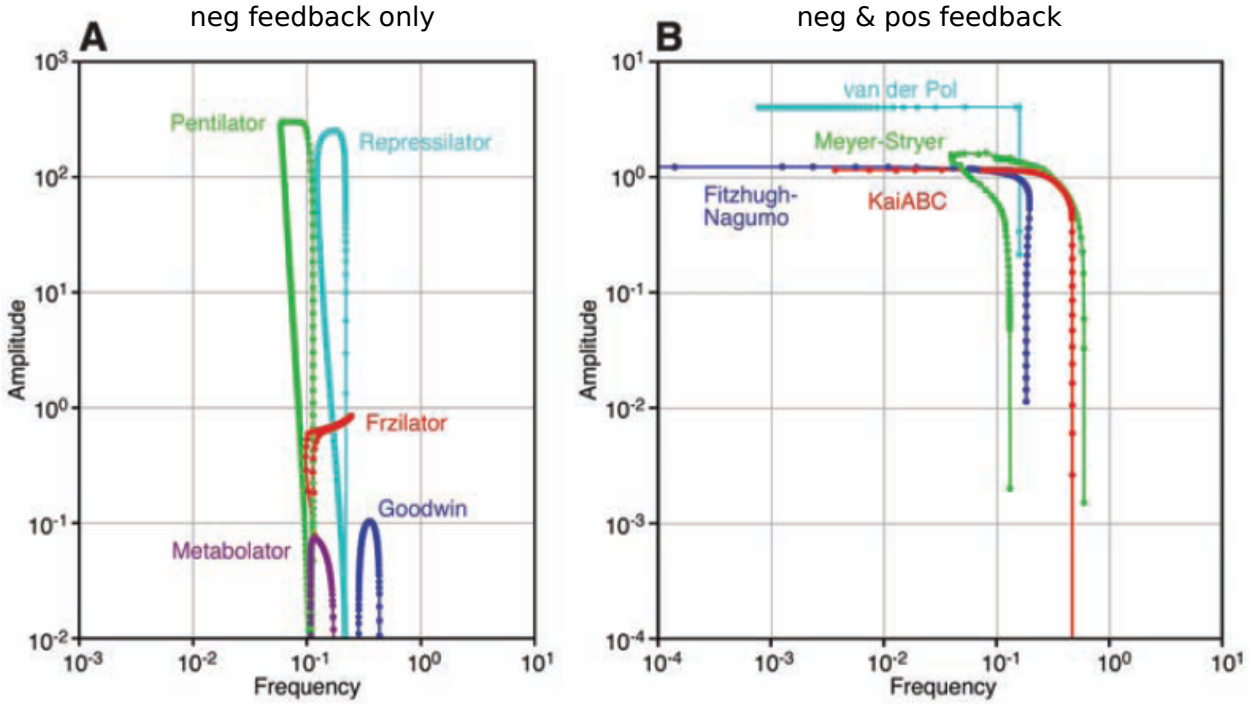
interlinked positive & negative feedback loops



"To construct amplitude vs. frequency curves, we first chose a bifurcation parameter and then identified the range of the parameter over which the system exhibited limit cycle oscillations by locating the Hopf bifurcations at which oscillations were born and extinguished. We then used an iterative algorithm to march along the chosen parameter between the two bifurcations. For each set of parameters we calculated the limit cycle solution of the system, keeping track of the amplitude and frequency of the limit cycle solution."

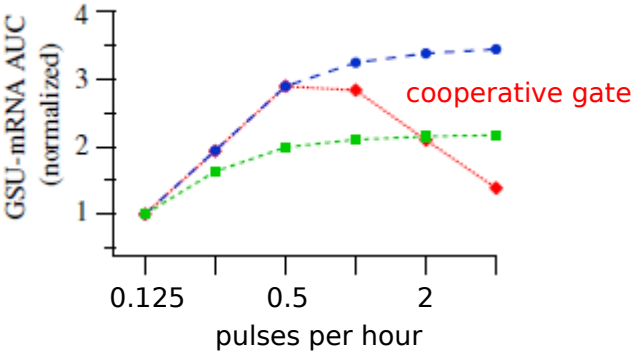
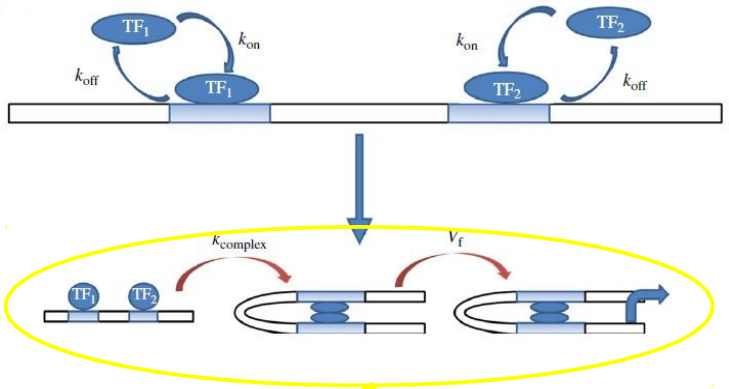
frequency decoding



Tsaneva-Atanasova, Mina, Caunt, Armstrong, McArdle, “*Decoding GnRH neurohormone pulse frequency by convergent signalling modules*”, J R Soc Interface **9**:170-82 2012

but how does this work at the promoter?

"In the CO-OPERATIVE GATE scenario, the transcription factors bind at independent promoter sites. After initial binding of the transcription factors to DNA the transcription factors interact to bring promoter sites in close proximity."



$$\frac{\mathrm{d}[\mathrm{GSU}]}{\mathrm{dt}} = K_{\mathrm{complex}} \times \left(\frac{[\mathrm{TF_1}][\mathrm{TF_2}][\mathrm{DNA_{TOT}}]^2 / K_{\mathrm{d_{TF1}}} K_{\mathrm{d_{TF2}}}}{(1 + [\mathrm{TF_1}]/K_{\mathrm{d_{TF1}}} + [\mathrm{TF_2}]/K_{\mathrm{d_{TF2}}})^2} \right) - d_{\mathrm{GSU}}[\mathrm{GSU}],$$

?

X

$$\begin{aligned} [\mathrm{TF_1}] + [DNA] &\rightleftharpoons [\mathrm{TF_1} : DNA], \\ [\mathrm{TF_2}] + [DNA] &\rightleftharpoons [\mathrm{TF_2} : DNA], \\ [\mathrm{TF_1} : DNA] + [\mathrm{TF_2} : DNA] &\rightleftharpoons [\mathrm{TF_1} : \mathrm{TF_2} : DNA]. \end{aligned}$$

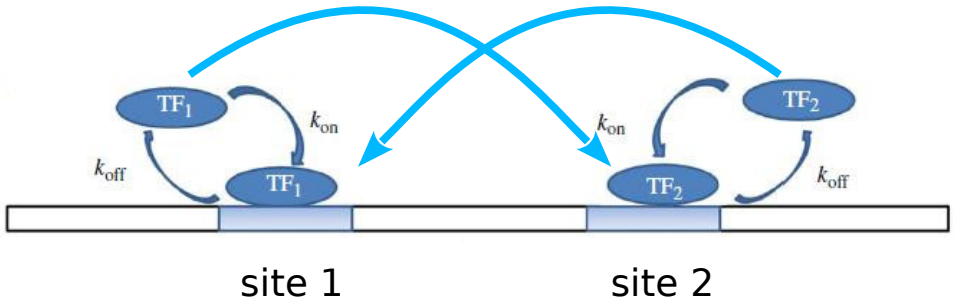
!!

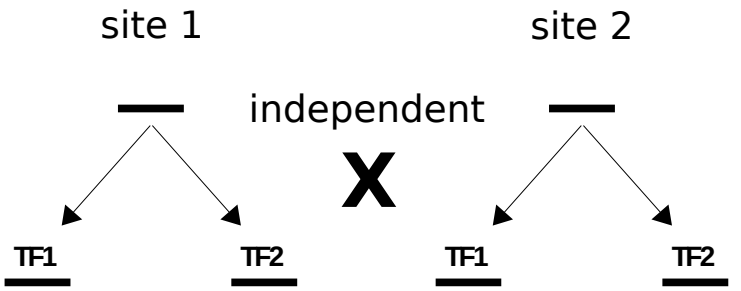
Tsaneva-Atanasova, Mina, Caunt, Armstrong, McArdle, "*Decoding GnRH neurohormone pulse frequency by convergent signalling modules*", J R Soc Interface **9**:170-82 2012 and SI

oops ... but, happily, all is not lost

if both transcription factors bind to each site with the same affinity but in a **mutually exclusive way**

and the two bindings are **independent** of each other (no cooperativity)





that gives the partition function $(1 + [TF_1]/K_{d_{TF1}} + [TF_2]/K_{d_{TF2}})^2$ in the denominator

the numerator term $[TF_1][TF_2]/(K_{d_{TF1}} K_{d_{TF2}})$ arises if both TFs must be bound for transcription to occur – “transcriptional synergy”
